

WHAT IS CLAIMED IS:

1. An apparatus that is characterized in that a circulating transfer of which one side is fixed presses a portion needing a therapy.

2. The apparatus of claim 1, wherein said transfer circulating with one side fixed presses a surrounding portion of eyes.

3. The apparatus of claim 1, wherein said transfer circulating with one side fixed presses a surrounding portion of temple.

4. The apparatus of claim 1, wherein said transfer circulating with one side fixed presses an engaging muscle between upper and lower teeth.

5. The apparatus of claim 1, wherein said transfer circulating with one side fixed presses a surrounding portion of back of head.

6. An massage apparatus that is characterized in that a driving apparatus driving a circulating transfer is installed at a cell phone, and said transfer presses a portion needing a therapy.

7. An massage apparatus that is characterized in that a transfer driven by a

repulsive force of a rotation member is provided at a cell phone, and said transfer presses a portion needing a therapy.

8. A method for maintaining the same glasses eyesight as the previous
5 eyesight by changing a low power glasses after the eyesight is enhanced.

9. A massage apparatus that is characterized in that a transfer driven by a repulsive force of a rotation member presses a portion needing a therapy.

10. The apparatus of either claim 1 or 6, wherein said circulating transfer having a stabilization weight of which one side is fixed presses a portion needing a therapy.

11. The apparatus of claim 1, wherein a circulating transfer with one side fixed
15 presses on a head skin for thereby massaging a head skin.

12. The apparatus of claim 1, wherein said transfer is provided in multiple numbers, and both sides of the same are designed to get longer, and the center portion of the same is designed to get shorter, wherein the transfer presses a head
20 skin, holding a handle installed therein.

13. The apparatus of claim 1, wherein said transfer is provided in multiple numbers, and both sides of the same are designed to get higher, and the center portion of the same is designed to get lower, wherein the transfer presses a head skin, holding a handle installed therein.

5

14. The apparatus of claim 1, wherein a plurality of transfers are provided, the length of the transfer is determined to match with the upper side of the head, and the length of the transfer is set so that one side of the same is matched with the back of head, and the transfer is designed to press the temple, and the transfer is
10 designed to press the muscle capable of moving the upper and lower teeth, and the transfer presses the eye part, and the transfer capable of achieving a desired massage on the entire above portions or a part of the same is cooperated with a rotation generation part.
